Chess Improvement Report

Performance Overview

Record: 1 win, 0 draws, 0 losses (100% score from this sample) **Errors per game:** 1 blunder, 1 mistake, 3 inaccuracies

You won the game, so credit where it's due — but the shape of the errors is revealing. The biggest concern isn't that you played badly; it's that **your worst move of the game came in a completely winning endgame** (a 444 cp blunder on move 37). That's a pattern worth addressing before it starts costing you full points against stronger opposition. The opening phase accumulated 3 inaccuracies, suggesting you're navigating by feel rather than by concrete plans out of the gate.

Opening Analysis

You played a **D06 — Queen's Gambit, irregular Black defense** (likely the Baltic Defense or Symmetrical Variation). With only 1 game in the sample, the "Unknown" label just means the engine saw an early deviation from main-line theory.

Three opening inaccuracies in a single game tells me you're probably not grounded in the Queen's Gambit's **core strategic ideas**: - The battle for the **e4 square** and the c-file - When to play **cx d5** (transposing to Exchange Variation) vs. maintaining tension - The **minority attack** plan with b4–b5 in QGD structures

Concrete recommendation: Study the Queen's Gambit from White's side systematically. I'd recommend: - **"Chess Structures" by Mauricio Flores Rios** — the chapter on Carlsbad and Slav structures is gold - **Lichess Study: "Queen's Gambit for White"** (search the Lichess study library) - **Hanging Pawns YouTube channel** — his QG series is free and excellent

Pick **one** response to 1...d5 (Exchange, Catalan, or main-line QGD) and stick with it for 50+ games.

Tactical Weaknesses

Your error distribution is unusual and instructive: - **Opening:** 3 inaccuracies (imprecise, but not losing) - **Middlegame:** 1 mistake (25. d5 instead of Kf1, a 133 cp drop) - **Endgame:** 1 blunder (the 444 cp disaster at move 37)

The pattern: **your accuracy degrades as the game simplifies**. Many players are the opposite — they calculate sharply when pieces are on the board and relax in the endgame. You seem to **lose focus when the position feels "won."**

The move 25. d5 is telling — Stockfish preferred **Kf1** (a king safety/prophylactic move) over an ambitious pawn push. This suggests you tend to **push for activity when the position calls for patience**. That's a concrete pattern: over-urgency.

Critical Moments Breakdown

Blunder: 37. Ke5?? (instead of b3), losing 444 centipawns

Position: 8/p2k1pp1/1p1P3p/2pK1P2/6PP/P7/1P6/8

You have a passed d6-pawn, a king on d5, and White's pieces are dominating. **b3** is the quiet, winning move — it prepares b4 to fix Black's queenside pawns and create a second passer. Instead, you played **Ke5**, walking your king forward prematurely.

Why Ke5 fails: it abandons control of the d-file and likely allows Black's king to get to c6, blockading d6 and potentially targeting your own pawns. In king-and-pawn endgames, **the king must not advance until it has the support of pawns or the opposition.**

Concept missed: *Don't hurry* (Capablanca's principle). In technically winning endgames, fix the opponent's weaknesses **before** activating your king. Zugzwang wins these positions, not speed.

Mistake: 25. d5 (instead of Kf1), -133 cp

You pushed for a central break when a quiet king move was objectively better. This is the same disease in a different phase — **playing actively when prophylaxis wins.**

Concept missed: Dvoretsky's concept of **prophylactic thinking** — "What is my opponent threatening? What would they play if it were their move?" A Kf1 move suggests there was a latent tactical issue on the first rank or along a diagonal you didn't address.

Your Improvement Plan

1. Tactical Drill: Endgame Studies, Not Just Tactics

Stop grinding random puzzles. Go to **Chess.com's Endgame Trainer** or **Lichess Practice** → **Endgame** and drill: - King and pawn vs. king (opposition, key squares) - Passed pawn technique with kings involved - Do **15 minutes daily** for 30 days. Your 37. Ke5 blunder is exactly the position type these drills fix.

2. Opening Tightening

Pick a concrete Queen's Gambit repertoire. My recommendation: **the Exchange Variation** (1.d4 d5 2.c4 e6 3.Nc3 Nf6 4.cxd5 exd5 5.Bg5). It gives you a clear plan (minority attack), a recognizable pawn structure, and rewards strategic understanding over memorization. Resource: **"Winning with the Slow (but Venomous!) Italian" no** — for QG specifically, use **Chessable's "Lifetime Repertoires: Queen's Gambit"** or the free IM John Bartholomew YouTube series.

3. Middlegame Concept: Prophylaxis

Read **"Mastering Chess Strategy"** by Hellsten, Chapter on Prophylaxis. Before every committal move (pawn break, piece trade), ask yourself: *"What would my opponent play if I passed?"* This would have caught 25. d5.

4. Endgame Priority: Technique in Winning Positions

Your 444 cp endgame blunder is your biggest red flag. Get **"100 Endgames You Must Know"** by Jesús de la Villa. Focus on the first 30 positions — they cover K+P endings and fundamental passed-pawn technique. Use the accompanying **Chessable course** for spaced repetition.

5. Mental Habit: The "Won Position" Checklist

When you believe the position is winning, **slow down, don't speed up**. Adopt this 3-question checklist before every move in a winning position: 1. What is my opponent's **ONLY** active idea? (Stop it first.) 2. Is there a move that improves my worst-placed piece/pawn without committing? 3. Am I playing the move because it's *best*, or because it *feels decisive*?

Winning won games is the single biggest rating-booster for players in your range. You already generate winning positions — now learn to close them out cleanly.

Final thought: You won this game, so the work here is about **raising your floor**, not your ceiling. A player who doesn't blunder in winning endgames picks up 100+ rating points almost for free. Start with the endgame trainer tonight.
